Table of Contents

1. Evalutaion 3
1.1 Strengths 3
1.2 Weaknesses 3
1.3 Improvments 3
2. Functional Testing 5
3. Test using Standard, Extreme and Abnormal Data 6

1. Evalutaion

1.1 Strengths

1. Users can bookmark many degrees (up to 250) so that they can keep track of which degrees to apply for once they make their applications. Using the search function, users can easily find the specific degree that they have bookmarked.

2. The browser's flow makes it convenient for users to find a degree. From the university's page, they can go straight to a faculty's page, then a degree's.

3. The Degree Finder function makes finding a degree based on location, faculty and/or university incredibly easy. It accurately shows only the desired degrees, and the user can go straight to the degree's page and bookmark it if they wish.

1.2 Weaknesses

1. The search function should have allowed users to select a university as a filter, since this function is intended to keep the application process in mind. Without this, it will be difficult for users to find the degrees that they have bookmarked for the university they are currently applying for.

2.
    a. The program does not provide links to the universities' websites on the university's page, which is inconvenient.
    b. The description text is not displayed correctly, making it difficult to read, especially for degree descriptions.
3.
    a. It would be more helpful if the Degree Finder table also displayed the degree's university and faculty. As it stands, the table only displays the name of the degree.
    b. After navigating to a degree's page, the [Back] button should take the user back to the Degree Finder, however it navigates to the degree's faculty's page instead.
4. Layout
    a. For unknown reasons, the program opens using the incorrect window size. Manually changing this causes the top of the GUI to increase in size vertically, creating a large grey area.

1.3 Improvments

1. Add a dropdown menu containing the list of universities. If the user selects one, use an algorithm similar to the Degree Finder's to filter the results, showing degrees from the selected university only.
2.
    a. Add a hyperlink to the university's website in an appropriate location on the screen.

b. The descriptions were not copied correctly into the Database. Fixing this mistake would resolve the issue.

3.

a. Improve the algorithm that is responsible for creating table models. Currently, tables are designed to only have one column. The algorithm should be changed to also include the university and faculty names in the first dimension of the 2D array.
b. Use a variable to keep track of the previous page's ID. When the [Back] button is clicked, call this variable and use it to navigate the user to the page that they were actually on previously.

2. Functional Testing

	Function	Achieved?
1	The user will be able to view a list of their saved degrees.	Yes
2	[View] will take the user to the selected degree's screen.	Yes
3	[Remove] will remove the entry from the table.	Yes
4	The user will be able to input and save their marks for 8 subjects	Yes
5	The numbers 0-100 can be used	Yes
6	The user will be able to select what subjects they did in Grade 12	Yes
7	The user will be able to view the list of universities in the database	Yes
8	The user can also search for a specific university using the search bar	Yes
9	The user can click on a university to view more information about it	Yes
10	The user will be able to click a faculty to view more information about it	Yes
11	The user will be able to click a degree to view its requirements	Yes
12	The user will be able to view the list of degrees in the database	Yes
13	The user will be able to apply filters to narrow down the results	Yes
14	The user will be able to click on a degree to view more information about it.	Yes

6: Not all possible subjects are considered in the options.

3. Test using Standard, Extreme and Abnormal Data

Mark received in a subject	Values	Expected Result	Actual Result
Standard	73	Accepted	Accepted
Extreme	0	Accepted	Accepted
Abnormal	123	Impossible to input	Impossible to input
